

Uber: Uberpool

Brief

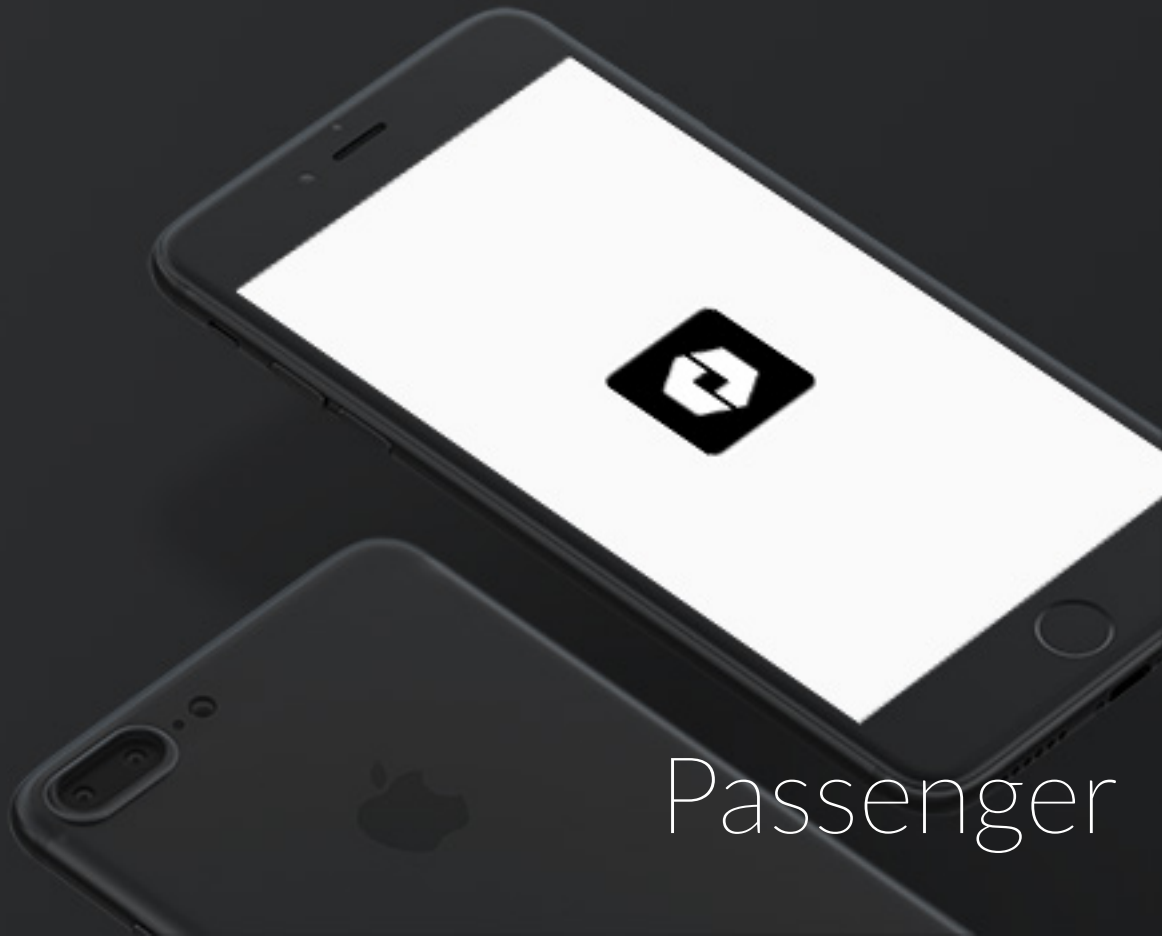

Uber is a widely used car sharing service available in many cities around the world. Uber recently added its Uberpool concept, the small change affects both the driver app and the passenger app.

To integrate the new feature, I added a new section in the profile screen for the passenger and a push notification for the driver.

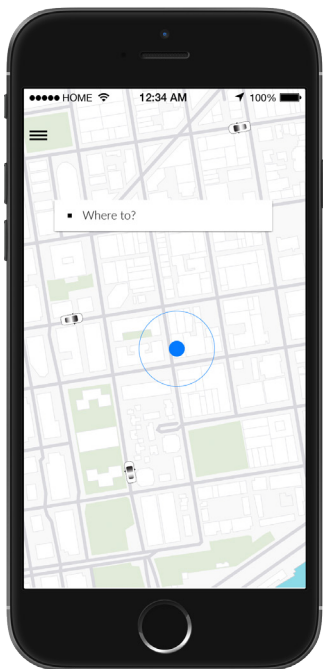

For the driver app, a notification feature will inform the driver that it will be a passenger or Uberpool ride. After accepting the request, directions to the first destination are added. Once the first pick up is made, directions to the second destination are added, and then to the final destination after the subsequent pick up.

For the passenger app, a new section will be added to the profile screen titled *Uberpool*.

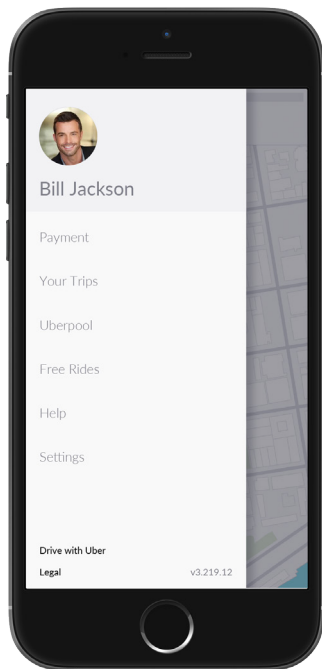

This new feature will allow the user to add friends and family to their Uberpool. The process of adding a person to your Uberpool is simple, just add their name, and number; and then Uber will retrieve the account from their database and add the individual to your Uberpool. If you decide to go on a trip with a friend who is not at the same location, simply open the app, select the friend in Uberpool and wait for pick up.

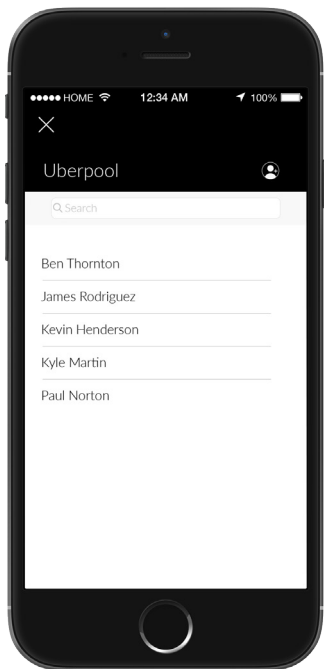

Passenger

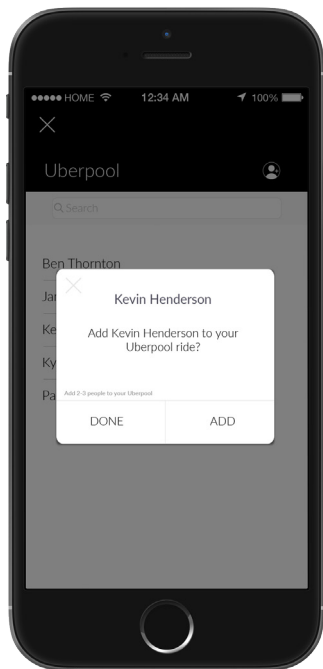

Tap the toggle

Tap on Uberpool

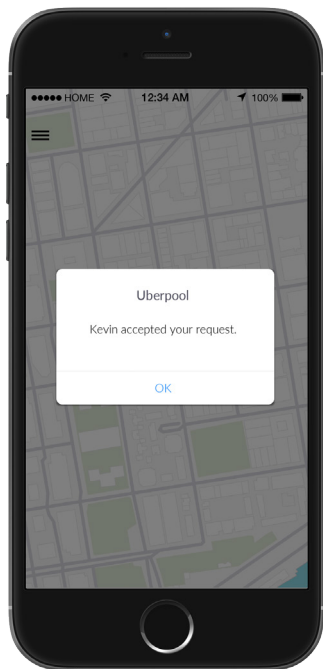

Select Uberpool passenger

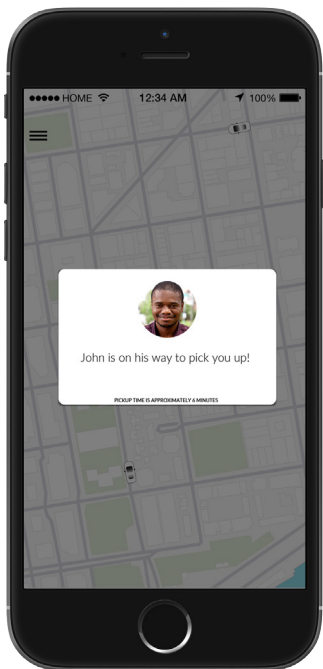

Add multiple passengers

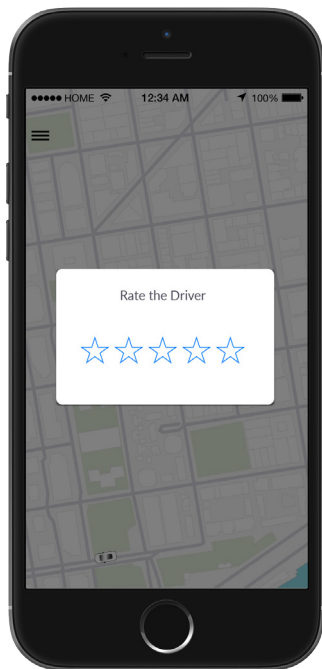

Load screen

Friend accepts Uberpool request

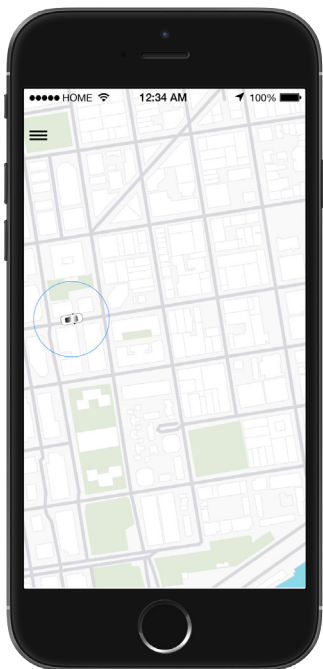

Wait for Uber driver

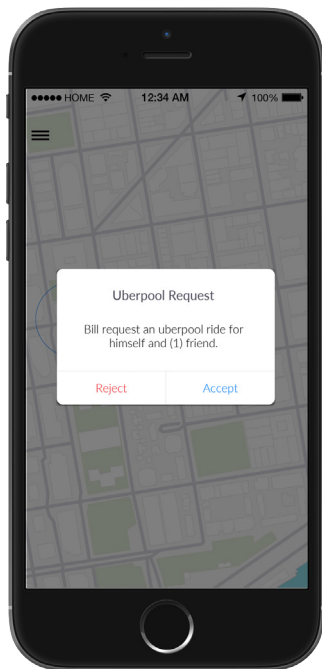

Rate Uber

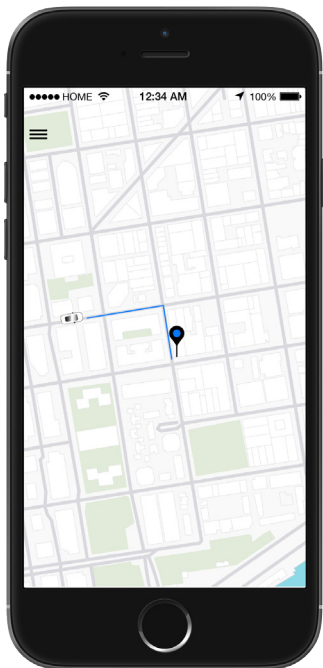

Driver

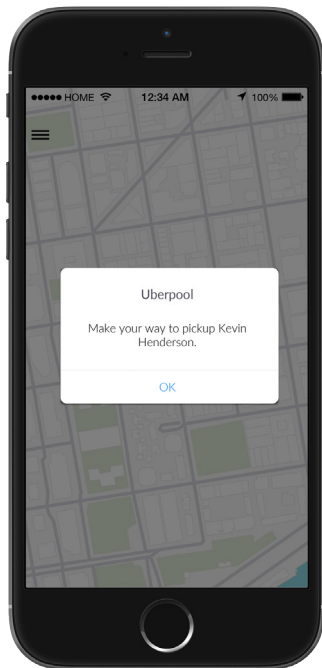

Wait for passenger

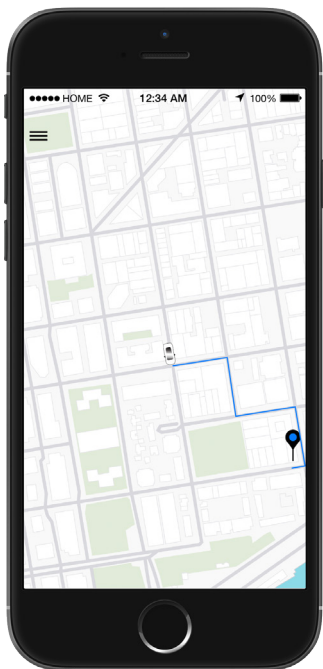

Uberpool request

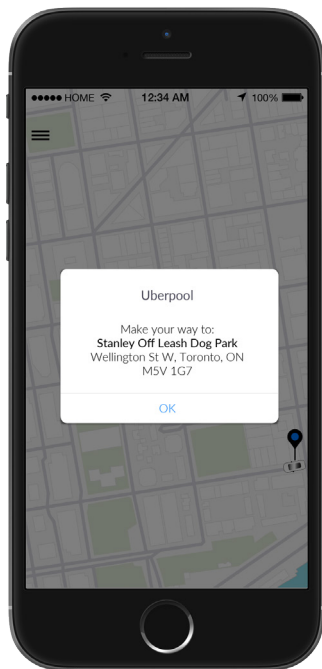

Accept request, pickup first passenger

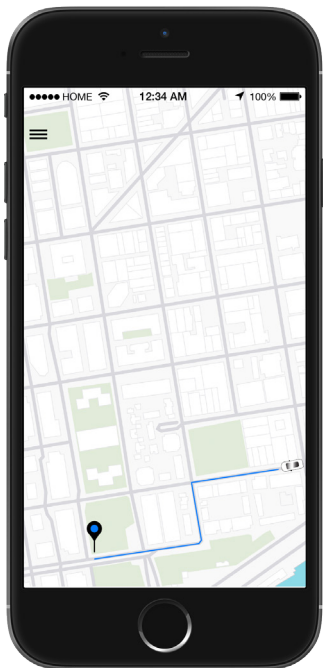

Make your way to second passenger

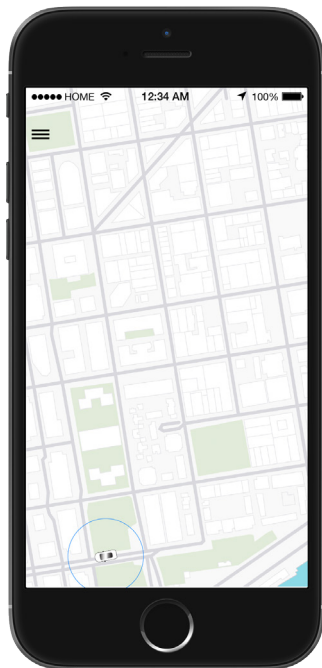

Directions to second passenger added

Go to the final destination

Directions to final destination added

Look for new passengers
